

CAPTURING INVOICE DATA WITH DIGITAL CAPTURE SOFTWARE & SERVICES

HOW DOES IT WORK

Our invoice capturing clients use our software and services to handle: Incoming invoices, outgoing invoices, Converting PDF to Peppol, Extracting line-items, etc.

Invoices are sent to our solution using email, SFTP or Rest API.

Then we extract the information that we have agreed upon to support the requirements our clients have.

Then we do manual checks (verification) on the data. This is done by our partner Pro Account Lanka Ltd in Colombo (Sri Lanka). A business owned by our Norwegian co-owners.

Then all data is exported to your system of choice by email, SFTP, web-service, etc. Using the format that you desire. We are really good at integrations – and can deliver almost all formats. Try us out.

Can I verify myself: Yes. If you would like to verify your own invoices you can do that. You will get your own users with access to your invoices only.

HOW MUCH TIME CAN I SAVE?

The time saved on the actual punching of data is obviously very high, but you should also consider the time you are freeing up on human errors in your accounting system/process. We see that we deliver close to 100% accurate data, and these data will give you effective processes when receiving them from us.

These data are very valuable – and a good idea could be to use these alongside an AI based accounting software. We have experience with this ourselves – and even though AI and Machine Learning cannot

replace a good accountant (we believe) – it can absolutely help increasing automation and reduce time spent pr. Invoices.

CAN I TEST IT OUT?

Yes absolutely – contact us through our website or at info@digitalcapture.no.

We can show you a demo – or you can choose to try the solution free of charge for a period of time (normally 1 month).
